AutoCAD LT AutoCAD LT, the free, downloadable version of AutoCAD, was originally based on AutoCAD 2002. AutoCAD LT 2005 introduced several new features, such as: New graphical features, including an updated default 2D/3D view. The ability to see and edit the active drawing view. The ability to use AutoLISP to perform graphic operations on any layer in the drawing. AutoCAD LT 2005 also added improved edit, draw, and activate methods for annotations and text objects. AutoCAD LT 2007 introduced a new object-oriented interface, with three main view modes, full screen, sidebar, and task pane. Such a package is designed to contain a longitudinally stretched packet of food items, such as potato chips or cigarettes. The package is provided with an end closure. 2. The Prior Art With packages of this type, it has been possible to apply two layers of material which are superimposed, that is one on top of the other. This arrangement has been found to be satisfactory for many applications. However, it has the disadvantage that it does not insure the adhesion of the two layers and it is not easy to apply the material which is to form the first layer on top of the other material which is to form the second layer. This is often difficult to achieve without the risk of introducing air bubbles. The purpose of the present invention is to overcome this disadvantage, that is to provide a multi-layer package wherein the layers are adhered and where it is also possible to produce such a package by using automatic machine equipment.[Progressive myoclonic epilepsy]. Progressive myoclonic epilepsy (PME) is a rare, epileptic syndrome of childhood. It is genetically determined. In this paper, we present the clinical data of 2 young siblings with PME. Both children were of normal intelligence. The first child developed clonic seizures at the age of 4 years. Seizures were triggered by sleep or fatigue. Prolonged seizures led to bilateral synchronous paroxysmal myoclonias. The children were hospitalized several times. Thereafter, a chronic course of the disease was observed. The myoclonic activity often disappeared spontaneously, but was re-emerging. The second child developed jerks and tonic seizures at the age of 4 years. He suffered from nocturnal myoclonia and suffered from multiple attacks of tonic seizures. The myoclonias were unspecific and did
