There are over 4000 types of ureters in the body, and each one is responsible for moving fluid from the kidney to the bladder and urine out through the urethra. Even though they all work together, each one works differently. Ureteral irritation can lead to damage to the kidneys, resulting in pain, changes in urine output, infection, kidney stones, and even the loss of a kidney. The Good Doctor tips: Rinse out your mouth after you eat. The food and water in your mouth can irritate your ureters, leading to reflux and pain. Drink plenty of water – it's important to stay hydrated so your kidneys don't work too hard. Have a healthy diet and be sure to eat a healthy protein diet. This will help you to get enough protein for the recovery of the lining of the ureter. Take an anti-inflammatory medication and/or over-the-counter pain medication. These can help with pain and inflammation. How can you tell if your kidneys are functioning normally? When a patient has back pain and kidney stones, it is often difficult to say what part of the problem is causing the pain. Some other symptoms of kidney stones are: Nausea and vomiting. Fever. If you experience any of these symptoms and believe they could be caused by a kidney stone, be sure to seek medical attention.
