Both LISP and AutoLISP are derivatives of the Lisp programming language developed at the Massachusetts Institute of Technology in the 1960s. The LISP programming language was made popular in the 1970s. AutoLISP is a general-purpose scripting language, also known as a "domain-specific language" (DSL), meaning it is designed for a particular task, rather than a general purpose language. This distinguishes it from Lisp, which is a general purpose programming language that supports object-oriented programming. AutoLISP compiles and runs directly in the computer, whereas Lisp needs to be interpreted and runs in a separate program on the computer. AutoLISP allows users to create custom commands and macros to automate tasks and access more than 2,000 predefined commands. The AutoLISP development environment, AutoLISPStudio, makes creating and executing AutoLISP modules easy. Automation with AutoLISP and AutoCAD Architecture AutoLISP is the programming language used by AutoCAD Architecture for customizing the software. The following table describes the functionality of each menu item: References Category:Computer-aided design software Category:3D graphics software1. Field of the Invention The invention relates to an information processing apparatus, an information processing method, and a computer-readable recording medium storing a program. 2. Description of the Related Art In recent years, multi-function devices are becoming widespread, including an electronic dictionary function as well as an electronic mail function, a Web browser function, and the like. The electronic dictionary function is a function of analyzing a document such as a newspaper or the like, and providing the analysis result as a search result. The electronic mail function is a function of providing a document such as an electronic mail or the like, which is held on an internal memory or an external memory, in a format suitable for the user's eyes. The Web browser function is a function of providing a document on a Web page or the like, which is held on a Web server or the like, in a format suitable for the user's eyes. However, in the related art, with the expansion of the number of functions of the multi-function device, the memory used for holding the analysis result or the like is increased, and thus, the cost of the multi-function device is increased. For example, when the electronic dictionary function is implemented, the document, which is analyzed, is held in the device. In order to hold many documents, an internal memory having a large capacity needs to be installed in the multi-function device. In addition, when the electronic mail function or the Web browser function is implemented, the document needs to be held in the device. In order to hold a large volume of documents, an internal memory having a large capacity needs to be installed in the multi-function device. Further, when a large-capacity memory is installed, the cost of the multi-function
