Safe AutoLogin is an easy to use tool that aims to keep your system secure and safe from unauthorized access. It consists of a small application that can be used to encrypt and store your user passwords. It can be used safely even if you allow other users to logon to your computer. There are two different methods to store passwords, one for local passwords and one for remote passwords. Both methods can be used, but they are separated in the GUI. The UI is very simple and easy to use. The program registers a shortcut on the Windows desktop. You can also change the message displayed when the program cannot be released. You can set a password for the shortcut and select your language. The first option is to encrypt the password locally on the host machine. The program will ask you for a password and then encrypt your password. The tool checks if the password is valid and will store a key that is used to decrypt your password. The second option is to upload the password to a remote server. In this case the server stores the password, while the program will be responsible for asking for it.
