## ScaffoldTreeGenerator

==== ScaffoldTreeGenerator is a Java-based application designed to generate the scaffold tree database independently of Scaffold Hunter. New scaffolds are added directly to the scaffold tree database. The resulting scaffold tree is traversed and all scaffolds contained therein are downloaded in a single job. Scaffolds existing in the scaffold tree database are not modified. They are just added to the tree or moved up one level. More information and examples on the scaffold tree generation process can be found in the official publication of Schuffenhauer et al. After the generation of the scaffold tree is finished, the resulting tree can be used with Scaffold Hunter, a Java-based tool to visualize and analyze the tree with its interactive query system. An example is shown below: ![Screenshot of the scaffold tree in Scaffold Hunter]( ScaffoldTreeGenerator Features: ===== ScaffoldTreeGenerator can be used to generate a scaffold tree database with all currently released scaffolds (i.e. everything in the database) or only a predefined set of scaffolds of choice. Additionally, ScaffoldTreeGenerator supports the generation of a scaffold tree database for all compounds with maximized length of the scaffold backbone. Finally, scaffold trees can be generated by a user-defined rule set. ScaffoldTreeGenerator is designed to be easy to use. A graphical user interface supports scaffold tree generation. The graphical user interface provides a toolbar and optionally an input field that allows a user to enter a scaffold name and its corresponding scaffold\_id. If the input field is used, the scaffold name and its scaffold\_id are displayed in the scaffold tree database when the program is started. Scaffolds can also be selected from a scaffold tree view of all scaffolds in the database. The scaffold tree generation process is started by selecting the scaffold tree generation mode from the toolbar.

## What's New In?

Classifier : This is the starting point for generating scaffold trees. A classifier is a user-defined rule set that classifies scaffolds according to their scaffold tree structure and/or other properties (e.g. scaffold shape, degree of similarity to molecules,...). Diffusion-weighted MR imaging of prostate cancer. Prostate cancer is the most commonly diagnosed malignancy among men. Positron emission tomography can detect prostate cancer at an earlier stage than can classic methods such as digital rectal examination and serum prostate-specific antigen determination. However, the sensitivity of positron emission tomography depends on the contrast between tumor and normal prostate tissue. Magnetic resonance imaging is more sensitive than positron emission tomography for the detection of early-stage prostate cancer. Diffusion-weighted imaging depicts a tumor earlier and more reliably than does the other magnetic resonance imaging techniques available for the detection of prostate cancer. The diffusion-weighted imaging pattern has a sensitivity and specificity comparable with that of dynamic imaging. 0x0C0D0E0F 0x1415161718191A1B1C1D1E1F2021222425262728 292A2B2C2D2E2F303132333435363738393A3B3C3D3E3F404142434445464748494A4B4C4D4E4F505152535455565758595A5B5C5D5E5F606162636465666768696A6B6C6D6E6F707172737475767778797A7B7C7D7E7F808182838485868788898A8B8C8D8E8F909192939495969798999A9B9C9D9E9FA0A1A2A3A4A5A6A7A8A9AAABACADAEAFB0B1B2B3B4B5B6B7B8B9BABBBCBDBEBE0F1F2F3F4F5F6F7F8F9FAFBFCFDFE0101030405060708090A0B0C0D0E0F101112131415161718191A1B1C
