

The application will then display the list of recovery operations that it can perform on the selected Windows system volume or partition. This includes potential operations in the BSD and Mac OSX file system. From there, you can select one of the data recovery methods. Since Disk Drill is full-featured recovery software, it includes all of the features you might expect, such as a scan of a system disk drive using all file systems, including FAT32, NTFS and exFAT, as well as recovery of Linux LVM RAID volumes. Select the Windows system volume or partition from the list of drives displayed in the applications main window. You can also choose to use a specific recovery method with the drop-down menu in the bottom right of the screen. The default is to use all recovery methods, but depending on the particular recovery situation, you can choose other options such as a partition search or a deep scan. Scanning the whole drive using all recovery methods offers the most complete results and will find more data than when employing a more limited scan. nOVA Science is a data recovery service that will recover all kinds of lost files, photos, documents and data, from any storage device like hard drive, SD card, pen drive, memory card, USB flash drive, etc.. Disk Drill is developed using the latest technology including threading, multi-core design and Intel 64-bit code. The program supports an unlimited number of disks. However, to prevent the creation of more than one set of logs, it can only handle a maximum number of 200 drives. The program supports RAID 0, 1 and 10

for RAID 0+1 and RAID 10+0 configurations. This Windows data recovery tool allows you to preview the files it has found before you commit to recovering them. Files identified by the tool are listed by file type in app windows to make it easy to locate them. Choose from Pictures, Video, Audio, Documents, Archives, and other files. Click on the appropriate window to see the files that have been

found during the scanning process. Disk Drill for Windows can recover data lost on hard drives and solid state drives of all sizes up to 2 TB. However, it is not as efficient for recovering data that is stored on external hard drives connected to a Mac or Linux operating system, although it can recover some data from these disks. Disk Drill is not capable of recovering data

from smart storage devices such as microSD cards and eMMC drives. Disk Drill data recovery software supports Windows 7 and Windows XP SP2, Windows Vista and Windows XP SP3 and earlier versions. Data recovery using the program is performed using the fastest data recovery algorithms. This includes hard drive recovery, partition recovery and file system recovery. The programs advanced

algorithms mean that it takes less time to recover data on older systems than if the drives had been installed in a new system.
